Abstract: In this paper, we consider a multi-layer quasi-geostrophic model of the ocean dynamics and we prove that the long-time behaviour of its solutions can be described by a finite number of determining parameters. Under some additional condition we also show that the dynamics of the bottom layer is completely determined by parameters connected with upper layers only. It means that the information about the bottom layer is not essential for a description of the long-time behaviour of the system under consideration.

Key-words: Determining degree of freedom, quasi-geostrophic model.

Nombre fini de degrés de liberté déterminants pour un modèle quasi-géostrophique multicouches de l'océan.

Résumé : Dans ce travail, on considère un modèle quasi-géostrophique multicouche de l'océan et on démontre que le comportement asymptotique de ses solutions peut être décrit par un nombre fini de paramètres déterminants. Sous certaines conditions supplémentaires, on montre également que la dynamique de la couche de fond est complètement déterminée par des paramètres connectés seulement aux couches supérieures. Ceci veut dire que l'information sur la couche de fond n'est pas essentielle pour décrire le comportement asymptotique du système que l'on considère.

Mots-clé : Degrés de liberté déterminants, modèle quasi-géostrophique.

1 Introduction.

Ocean circulation numerical modelling started in the sixties with Sarkisyan [23] and Bryan and Cox [3]. Still now, this problem remains under consideration and recently Lions, Temam and Wang proposed a modelisation for large scale ocean and atmosphere dynamics and developed a mathematical theory for the coupled atmosphere-ocean models [21][22]. The equations of the velocity are derived from the Navier-Stokes equations, with adjonction of the Coriolis' effect. The behaviour of temperature and salinity or density are described also by partial differential equations. Due to the complexity of the problem, simpler models were introduced. The quasi-geostrophic (QG) one is a simple formulation neglecting thermodynamics effects. First, the density is supposed to be constant and the equations are integrated on the vertical. This results in a two-dimensional Navier-Stokes equation with the Coriolis' effect. The QG model corresponds to the streamfunction-vorticity formulation of this equation. In fact, assuming the density to be constant in the ocean is a rough approximation. Thus in order to improve the model, Holland [16] introduced a two-layer formulation of this model, assuming the density is constant in each layer. The QG equation is written in each layer with a suitable coupling through convection terms. More recently similar models with K -layers have been introduced [20]. In this paper we consider the K -layers QG formulation of the ocean dynamics. We are first interested in which parameters can be used for the description of the long-time behaviour of the solutions to the problem (1)-(7), and second in how many parameters are necessary for this description. These questions are inspired by the paper of Foias-Prodi [13] about determining modes for the 2D Navier-Stokes equations and are extensively discussed in the literature (see, e.g. [5], [6], [7], [9],[10],[12]-[15],[17],[18]). The concepts of determining nodes and determining local volume averages were introduced in [14] and [15] [17] respectively. A general approach to the problem of the existence of a finite number of determining parameters (degrees of freedom) was discussed in [7], [9], [10].

2 Model equations and preliminaries.

We consider ocean dynamics in the quasi geostrophic formulation, i.e. all thermodynamic effects are neglected. The vertical structure of the ocean is modelled by splitting the domain Ω into K layers of depth thickness H_k . The equation of the

dynamics then reads [16, 20]

$$\frac{\partial \theta_k}{\partial t} + J(\psi_k, \theta_k + \beta y) = \mu \Delta^2 \psi_k + F_k^{wind} - D_k^{bottom} \quad \text{in } \Omega, \quad k = 1, \dots, K, \quad (1)$$

$$\theta = \Delta \psi - \mathcal{W} \psi \quad \text{in } \Omega \quad (2)$$

where $\psi = \psi_k(x, y)$, $k = 1, \dots, K$ is the quasi geostrophic streamfunction of the k -th layer. We suppose that Ω is a bounded open subset of \mathbb{R}^2 with smooth boundary $\partial\Omega$. The k^{th} layer is characterized by its thickness H_k , its reduced gravity g_k and its streamfunction ψ_k . The forcing F_k^{wind} infers only on the upper layer: $F_k^{wind} = 0$ for $k \neq 1$ and $F_1^{wind} = v/H_1$, where v is equal to the curl of the wind stress on the surface and is supposed to be in $L^2(\Omega)$. The bottom drag is $D_k^{bottom} = 0$ for $k \neq K$ and $D_K^{bottom} = \sigma \Delta \psi_K$. We consider the linear approximation only of the parameter of Coriolis $f = f_0 + \beta y$ where f_0 and β are the parameter of Coriolis and its meridional gradient in the middle of the bassin. The Jacobian operator is defined by

$$J(u, v) = \frac{\partial u}{\partial x} \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \frac{\partial v}{\partial x}. \quad (3)$$

The matrix \mathcal{W} is the $K \times K$ tridiagonal matrix defined by

$$\mathcal{W} = \begin{pmatrix} R_1 & -R_1 & \cdots & 0 \\ -R'_2 & R_2 + R'_2 & -R_2 & \cdots \\ \vdots & \ddots & \ddots & \ddots \\ 0 & \cdots & -R'_K & R'_K \end{pmatrix} \quad \text{where} \quad \begin{cases} R_k = \frac{f_0^2 \rho_0}{g H_k (\rho_{k+1} - \rho_k)} \\ R'_k = \frac{f_0^2 \rho_0}{g H_k (\rho_k - \rho_{k-1})} \end{cases} \quad (4)$$

where ρ_0 is the mean density of water, ρ_k is the mean density in the k -th layer and g is the gravity acceleration.

We notice that the matrix \mathcal{W} has a complete system of eigenvectors. We thus introduce Λ the non-negative diagonal matrix of the eigenvalues of \mathcal{W} , and define the matrix B so that $\Lambda = B^{-1} \mathcal{W} B$. We shall denote each vector in the eigenbasis of \mathcal{W} by a star:

$$\psi^* = B^{-1} \psi, \theta^* = B^{-1} \theta, \text{etc.} \quad (5)$$

We supplement (1) and (2) with the following boundary conditions :

$$\left\{ \begin{array}{ll} \theta(x, y, t) + \mathcal{W}\psi(x, y, t) = 0 & \text{on } \partial\Omega \times]0, T[, \ k = 1, \dots, K \\ \psi_k^*(x, y, t) = C_k^*(t) & \text{on } \partial\Omega \times]0, T[, \ k = 1, \dots, K \\ \int_{\Omega} \psi_k^* d\omega = 0, & k = 2, \dots, K, \\ C_1^* = 0. \end{array} \right. \quad (6)$$

Let us point out here that $(C_k^*(t))_{2 \leq k \leq K}$ are unknown functions. Finally, the initial data is

$$\theta_k(x, y, 0) = \theta_{0,k}(x, y) \text{ in } \Omega, \ k = 1, \dots, K, \quad (7)$$

where $\theta_{0,k}(x, y)$ is in $H^{-1}(\Omega)$, $k = 1, \dots, K$. The unknown functions are $\psi_k(x, y, t)$, $\theta_k(x, y, t)$ and $C_k^*(t)$. From now on, we denote by $\mathbf{H}^{-1}, \mathbf{L}^2, \mathbf{H}^1$, and so on the spaces $(H^{-1}(\Omega))^K, (L^2(\Omega))^K, (H^1(\Omega))^K$ etc. We also introduce the constant $p_k, k = 0, \dots, K$ defined by $p_0 = 0, p_K = 0, p_k = \frac{f_0^2 \rho_0}{g(\rho_{k+1} - \rho_k)} = H_k R_k = H_{k+1} R'_{k+1}, k = 1, \dots, K-1$. As in [2], we will use the norm $\|\cdot\|_{-1}$ on \mathbf{H}^{-1} defined by the scalar product

$$((\theta, \bar{\theta})) = \sum_1^K H_k \int_{\Omega} \nabla \psi_k \cdot \nabla \bar{\psi}_k + \sum_i^K p_k \int (\psi_k - \psi_{k+1}) \cdot (\bar{\psi}_k - \bar{\psi}_{k+1}),$$

where ψ (resp. $\bar{\psi}$) are defined by θ (resp. $\bar{\theta}$) as the solution to the equation (2) with the boundary conditions

$$\left\{ \begin{array}{ll} \psi_1^*(x, y) = 0 & \text{on } \partial\Omega, \\ \psi_k^*(x, y) = C_k^* & \text{on } \partial\Omega, k = 2, \dots, K \\ \int_{\Omega} \psi_k^* d\Omega = 0, & k = 2, \dots, K, \end{array} \right. \quad (8)$$

where ψ^* is defined according to (5). We note (see e.g.[1]) that the problem (2), (8) has a unique solution in \mathbf{H}^1 for any $\theta \in \mathbf{H}^{-1}$ and that the norm $\|\cdot\|_{-1}$ is equivalent to the usual norm on \mathbf{H}^{-1} and

$$a_1 \|\nabla \psi\|_{\mathbf{L}^2} \leq \|\theta\|_{-1} \leq a_2 \|\nabla \psi\|_{\mathbf{L}^2}. \quad (9)$$

We recall some properties of the Jacobian operator in the following lemma [1],[2].

Lemma 2.1 *The operator Jacobian verifies, for u, v, w in $H_0^1(\Omega) \times H_0^1(\Omega) \times H_0^1(\Omega)$*

$$\begin{aligned} J(u, v) &= -J(v, u), & \int_{\Omega} J(u, v) d\omega &= 0, \\ \int_{\Omega} J(u, v) w d\omega &= \int_{\Omega} J(v, w) u d\omega, \\ \left| \int_{\Omega} J(u, v) \Delta u d\omega \right| &\leq c_4 \|v\|_{H^2} \|\nabla u\|_{L^2} \|\Delta u\|_{L^2}. \end{aligned}$$

These properties remain valid for functions u, v, w constant on the boundary $\partial\Omega$.

From now on, we use the following notations :

$$\left. \begin{aligned} &\|\cdot\| = \|\cdot\|_{L^2}, \\ &\lambda_1 \text{ is the first eigenvalue of the operator } -\Delta \text{ with Dirichlet boundary conditions,} \\ &c_1 \text{ is the constant of the Sobolev embedding } \|\psi\|_{L^\infty} \leq c_1 \|\psi\|_{H^2}, \\ &c_2 \text{ is a constant such that } c_2 \|\theta\|_{-1} \leq \sum H_k \|\Delta\psi_k\|, \\ &c_4 \text{ is a constant such that } \|\nabla\psi\|_{L^4}^2 \leq c_4 \|\nabla\psi\| \|\Delta\psi\|, \psi \in H_0^1(\Omega) \cap H^2(\Omega) \\ &c_\infty \text{ is a constant such that } \|\psi\|_{H^2} \leq c_\infty \|\Delta\psi\|, \psi \in H_0^1(\Omega) \cap H^2(\Omega) \\ &a_1 \text{ and } a_2 \text{ are constants such that} \\ &a_1 \|\nabla\psi\|_{\mathbf{L}^2} \leq \|\theta\|_{-1} \leq a_2 \|\nabla\psi\|_{\mathbf{L}^2}, \\ &H' = \min_{k=1, \dots, K} H_k. \end{aligned} \right\} \quad (10)$$

In this paper we rely on the following result proved in [2].

Theorem 2.1 *For $\theta_{0,k} \in H^{-1}(\Omega), k = 1, \dots, K$, and $v \in L^2(\Omega)$ and for all $T > 0$, the system (1)- (7) has a unique solution θ in $C([0, T], \mathbf{H}^{-1}) \cap L^2(0, T, \mathbf{L}^2) \cap L_{loc}^2(0, T, \mathbf{H}_0^1)$. The function ψ associated to θ by (2), (8) satisfies $\psi \in C([0, T], \mathbf{H}^1) \cap L^2(0, T, \mathbf{H}^2) \cap L_{loc}^2(0, T, \mathbf{H}^3)$. The semi-group $G(t)$ from \mathbf{H}^{-1} in \mathbf{H}^{-1} , $G(t)\theta_0(x) = \theta(t, x)$, associated to these equations, is dissipative in the following sense:*

$$\limsup_{t \rightarrow \infty} \|\theta(t)\|_{-1}^2 \leq \frac{\|v\|^2}{\mu^2 H_1 \lambda_1^2 c_2} \quad (11)$$

$$\limsup_{t \rightarrow \infty} \frac{1}{T} \int_t^{t+T} \sum H_k \|\Delta\psi_k\|^2 d\tau \leq \frac{\|v\|^2}{\mu^2 H_1 \lambda_1^2} \left(1 + \frac{1}{\mu T c_2}\right), \forall T > 0. \quad (12)$$

Moreover there exists a global attractor \mathcal{A} which is bounded in \mathbf{L}^2 , compact and connected in \mathbf{H}^{-1} and whose basin of attraction is the whole space \mathbf{H}^{-1} . This attractor has finite Hausdorff and fractal dimensions in \mathbf{H}^{-1} .

In particular this theorem means that the long-time dynamics of the considered system is described by a finite-dimensional set in the phase space and therefore, at least theoretically, we may describe the long-time behaviour of solutions to (1)-(7) by a finite set of parameters.

3 Statement of main results.

As in [9]-[10], we will use the following

Definition 3.1 A finite set $\mathcal{L} = \{l_j\}_1^M$ of linearly independent bounded linear functionals on the space $\mathbf{H}^2 = (H^2(\Omega))^K$ is said to be a set of determining degrees of freedom for the problem (1)-(7) if for any two solutions $\theta^1(t)$ and $\theta^2(t)$ satisfying

$$\lim_{t \rightarrow \infty} l_j(\psi^1(t) - \psi^2(t)) = 0, 1 \leq j \leq M$$

where ψ^i is defined from θ^i by (2) and (8), we have

$$\lim_{t \rightarrow \infty} \|\theta^1(t) - \theta^2(t)\|_{-1} = 0.$$

We note that, due to (9), the last inequality is equivalent to

$$\lim_{t \rightarrow \infty} \|\psi^1(t) - \psi^2(t)\|_{\mathbf{H}^1} = 0.$$

Our main results are the following assertions.

Theorem 3.1 Assume that the set $\mathcal{L} = \{l_j\}_1^M$ possesses the property

$$\|\psi\|_{\mathbf{H}^1} \leq C_{\mathcal{L}} \max_j |l_j(\psi)| + \varepsilon_{\mathcal{L}} \|\psi\|_{\mathbf{H}^2}, \quad (13)$$

for any $\psi \in \mathbf{H}^2$ with some positive constant $C_{\mathcal{L}}$ and $\varepsilon_{\mathcal{L}}$. Assume that

$$\varepsilon_{\mathcal{L}} < \frac{a_1}{a_2} \frac{\lambda_1 \mu^2}{\|v\|} \frac{\sqrt{H_1 H'}}{\sqrt{2} c_{\infty}^2} \min_{k=1, \dots, K} \left(\sqrt{\frac{H_k}{\alpha_k}} \right). \quad (14)$$

where

$$\alpha_k = 2c_4^2 H_k + 4 \frac{c_1^2}{\lambda_1} \left(\frac{p_{k-1}^2}{H_{k-1}} + \frac{p_k^2}{H_{k+1}} \right). \quad (15)$$

Then the set \mathcal{L} is a set of determining degrees of freedom for the problem (1)-(7).

The importance of the relation (13) for construction of determining sets of functionals was first observed in [9] (see also [10]).

Theorem 3.1 implies

Corollary 3.1 *Let T^h be a triangulation of the domain Ω made of triangles with sides less than h and let $\{x_j, j = 1, \dots, L_h\}$ be the set of all vertices of triangles from T^h . Then the set $\mathcal{L} = \{l_{j,k}(\psi) = \psi_k(x_j), j = 1, \dots, L_h, k = 1, \dots, K\}$ is a set of determining degrees of freedom for the problem (1)-(7) provided*

$$h < \frac{1}{C} \frac{a_1}{a_2} \frac{\lambda_1 \mu^2}{\|v\|} \frac{\sqrt{H_1 H'}}{\sqrt{2} c_\infty^2} \min_{k=1, \dots, K} \left(\sqrt{\frac{H_k}{\alpha_k}} \right),$$

where α_k is defined by (15) and C is the constant of approximation (see (16) below).

This corollary follows from well-known estimate (see e.g. [8]) for linear splines connected with the triangulation T^h of the smooth domain Ω :

$$\|\omega - S(T^h, \omega)\|_{H^1} \leq Ch \|\omega\|_{H^2}, \quad (16)$$

where $S(T^h, \omega)$ is the linear interpolation spline corresponding to $\omega \in H^2(\Omega)$.

Theorem 3.2 *Assume that $l_j \in \mathcal{L}$ do not involve the last component of the vector of the stream functions ψ_1, \dots, ψ_K , i.e. $l_j(\psi)$ is independent of ψ_K for any $\psi \in \mathbf{H}^2$ and that the set $\mathcal{L} = \{l_j\}_1^M$ satisfies*

$$\sqrt{\sum_{k=1}^{K-1} \|\psi_k\|_{H^1}^2} \leq C_{\mathcal{L}} \max_j |l_j(\psi)| + \varepsilon_{\mathcal{L}} \sqrt{\sum_{k=1}^{K-1} \|\psi_k\|_{H^2}^2}, \quad (17)$$

for any $\psi \in \mathbf{H}^2$ with some positive constant $C_{\mathcal{L}}$ and $\varepsilon_{\mathcal{L}}$. Assume also that the bottom friction σ satisfies

$$\mu \lambda_1 + 2\sigma \geq \frac{2}{H_K H_1} \frac{\|v\|^2 c_\infty^2 a_2^2}{\mu^3 \lambda_1^2 a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right). \quad (18)$$

Then the set \mathcal{L} is a set of determining degrees of freedom for the problem (1)-(7) provided

$$\varepsilon_{\mathcal{L}} < \frac{a_1}{a_2} \frac{\lambda_1 \mu^2}{\|v\|} \frac{\sqrt{H_1 H''}}{\sqrt{2} c_\infty^2} \min_{k=1, \dots, K} \left(\sqrt{\frac{H_k}{\alpha_k}} \right), \quad (19)$$

where α_k is defined by (15) and $H'' = \min_{k=1, \dots, K-1} H_k$.

From this theorem in the same way as corollary 3.1, we have

Corollary 3.2 *Assume T^h and $x_j, j = 1, \dots, L_h$ as in corollary 3.1. Then the set $\mathcal{L}^* = l_{j,k}(\psi) = \psi_k(x_j), j = 1, \dots, L_h, k = 1, \dots, K - 1$ is a set of determining degrees of freedom for the problem (1)-(7) provided (18) holds and*

$$h < \frac{1}{C} \frac{a_1}{a_2} \frac{\lambda_1 \mu^2}{\|v\|} \frac{\sqrt{H_1 H^n}}{\sqrt{2} c_\infty^2} \min_{k=1, \dots, K} \left(\sqrt{\frac{H_k}{\alpha_k}} \right),$$

where α_k is defined by (15).

Theorem 3.2 and Corollary 3.2 mean that in order to determine completely asymptotical dynamics of solutions, we need no information about the behaviour of the K -th layer. A similar effect was first observed in [6] for some classes of reaction-diffusion systems. It was shown there that under some conditions certain non-vanishing components of a solution are not essential for description of long-time dynamics. We also refer to [5] for discussion of this phenomenon for the second order in time evolution equations.

Theorem 3.3 *Assume that $\theta^{(j)}(t), j = 1, 2$ are two solutions belonging to the attractor. Assume also that either the condition (14) or conditions (18) and (19) are fulfilled. Let \mathcal{L} be the corresponding set of determining degrees of freedom. Then the property*

$$l(\psi^{(1)}(t)) = l(\psi^{(2)}(t)) \quad (20)$$

for any $l \in \mathcal{L}$ and $-\infty < t \leq t_0$ implies $\theta^{(1)}(t) = \theta^{(2)}(t)$ for $-\infty < t < \infty$.

A similar assertion on determining modes for the 2D Navier-Stokes equations was first obtain by Ladyzhenskaya in 1972 (see, e.g., references in [4], [19]).

As in [17],[18], we can also prove assertions similar to corollaries 3.1 and 3.2 and theorem 3.3 for local volume averages. In this case the determining functionals are defined by $l_j(\psi_k) = \frac{1}{h^2} \int_\Omega \psi_k(x, y) \lambda(\frac{x}{h} - j_1, \frac{y}{h} - j_2) d\omega$ where $\lambda(x, y) = 1$ for $(x, y) \in S = [0, 1] \times [0, 1]$ and $\lambda(x, y) = 0$ for $(x, y) \notin S$.

4 Proofs.

Proof of theorem 3.1. Consider $\tilde{\theta}$ and $\bar{\theta}$ two solutions of the system (1)-(6) with initial data $\tilde{\theta}_0$ and $\bar{\theta}_0$ respectively. We introduce $\theta = \tilde{\theta} - \bar{\theta}$, ψ defined by (2) and

(8). Then θ satisfies the system

$$\begin{aligned} \frac{\partial \theta_k}{\partial t} - \mu \Delta^2 \psi_k + D_k^{bottom} &= -J(\psi_k, \tilde{\theta}_k + \beta y) - J(\bar{\psi}_k, \theta_k) \quad \text{in } \Omega, \quad k = 1, \dots, K \\ \theta &= \Delta \psi - \mathcal{W} \psi \quad \text{in } \Omega. \end{aligned} \quad (21)$$

Since $\psi_k^*(x, y, t) = C_k^*(t)$ on $\partial\Omega$ by (6), let us introduce $C(t) = BC^*(t)$ and $\psi_k'(x, y, t) = \psi_k(x, y, t) - C_k(t)$. Multiplying (21) by $H_k \psi_k'$, integrating over Ω and summing on k , we obtain

$$\frac{1}{2} \frac{d \|\theta\|_{-1}^2}{dt} + \mu \sum_k H_k \|\Delta \psi_k\|^2 + H_K \sigma \|\nabla \psi_K\|^2 = \sum_k H_k (J(\bar{\psi}_k, \theta_k), \psi_k'). \quad (23)$$

Let us bound from above the right-hand side of this equation. We rewrite θ_k with its explicit form :

$$\theta_k = \Delta \psi_k - \frac{p_k}{H_k} (\psi_k - \psi_{k+1}) - \frac{p_{k-1}}{H_k} (\psi_k - \psi_{k-1}).$$

Thus,

$$\begin{aligned} \sum_k H_k (J(\bar{\psi}_k, \theta_k), \psi_k') &= \sum_k H_k (J(\bar{\psi}_k, \Delta \psi_k), \psi_k') - \\ &- \sum_k p_k (J(\bar{\psi}_k, \psi_k - \psi_{k+1}), \psi_k') - \sum_k p_{k-1} (J(\bar{\psi}_k, \psi_k - \psi_{k-1}), \psi_k'). \end{aligned}$$

An integration by part and lemma 2.1 allow us to bound from above the first term of the right-hand side of the above equality by

$$\left| \sum_k H_k (J(\bar{\psi}_k, \Delta \psi_k), \psi_k') \right| \leq c_4 \sum_k H_k \|\bar{\psi}_k\|_{H^2} \|\nabla \psi_k\| \|\Delta \psi_k\|. \quad (24)$$

On the other hand,

$$\begin{aligned} \left| \sum_k p_k (J(\bar{\psi}_k, \psi_k - \psi_{k+1}), \psi_k') \right| &= \left| \sum_k p_k (J(\psi_k', \psi_{k+1}), \bar{\psi}_k) \right| = \\ &\leq \sum_k p_k \|\bar{\psi}_k\|_{L^\infty} \|\nabla \psi_k\| \|\nabla \psi_{k+1}\|, \end{aligned}$$

$$\left| \sum_k p_k (J(\bar{\psi}_k, \psi_k - \psi_{k+1}), \psi_k') \right| \leq \frac{c_1}{\sqrt{\lambda_1}} \sum_k p_k \|\bar{\psi}_k\|_{H^2} \|\nabla \psi_k\| \|\Delta \psi_{k+1}\|. \quad (25)$$

Inserting the inequalities (25) and (24) in (23), we have

$$\begin{aligned}
& \frac{1}{2} \frac{d \|\theta\|_{-1}^2}{dt} + \mu \sum_k H_k \|\Delta \psi_k\|^2 + H_K \sigma \|\nabla \psi_K\|^2 \leq \\
& \leq c_4 \sum_k H_k \|\bar{\psi}_k\|_{H^2} \|\nabla \psi_k\| \|\Delta \psi_k\| + \\
& + \frac{c_1}{\sqrt{\lambda_1}} \sum_k p_k \|\bar{\psi}_k\|_{H^2} \|\nabla \psi_k\| \|\Delta \psi_{k+1}\| + \\
& + \frac{c_1}{\sqrt{\lambda_1}} \sum_k p_{k-1} \|\bar{\psi}_k\|_{H^2} \|\nabla \psi_k\| \|\Delta \psi_{k-1}\|.
\end{aligned}$$

$$\begin{aligned}
& \frac{1}{2} \frac{d \|\theta\|_{-1}^2}{dt} + \mu \sum_k H_k \|\Delta \psi_k\|^2 + H_K \sigma \|\nabla \psi_K\|^2 \leq \\
& \leq \sum_k \frac{\mu H_k}{4} \|\Delta \psi_k\|^2 + \sum_k \frac{c_4^2 H_k}{\mu} \|\bar{\psi}_k\|_{H^2}^2 \|\nabla \psi_k\|^2 + \\
& + \sum_k \frac{\mu H_{k-1}}{8} \|\Delta \psi_{k-1}\|^2 + \sum_k \frac{2c_1^2 p_{k-1}^2}{\lambda_1 \mu H_{k-1}} \|\bar{\psi}_k\|_{H^2}^2 \|\nabla \psi_k\|^2 + \\
& + \sum_k \frac{\mu H_{k+1}}{8} \|\Delta \psi_{k+1}\|^2 + \sum_k \frac{2c_1^2 p_k^2}{\lambda_1 \mu H_{k+1}} \|\bar{\psi}_k\|_{H^2}^2 \|\nabla \psi_k\|^2.
\end{aligned}$$

Then

$$\frac{d \|\theta\|_{-1}^2}{dt} + \mu \sum_k H_k \|\Delta \psi_k\|^2 + 2H_K \sigma \|\nabla \psi_K\|^2 \leq \frac{1}{\mu} \sum_k \alpha_k \|\bar{\psi}_k\|_{H^2}^2 \|\nabla \psi_k\|^2, \quad (26)$$

where α_k is defined by (15). Finally,

$$\begin{aligned}
& \frac{d \|\theta\|_{-1}^2}{dt} + \mu \sum_k H_k \|\Delta \psi_k\|^2 + 2H_K \sigma \|\nabla \psi_K\|^2 \leq \\
& \leq \frac{c_\infty^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \sum_k H_k \|\Delta \bar{\psi}_k\|^2 \|\theta\|_{-1}^2.
\end{aligned} \quad (27)$$

Assuming that the family \mathcal{L} fulfills (13), we have

$$\|\nabla \psi\| \leq C_{\mathcal{L}} \max_j |l_j(\psi)| + \varepsilon_{\mathcal{L}} c_\infty \|\Delta \psi\|.$$

It is easy to see that

$$\| \Delta \psi \|^2 \geq \frac{1-\delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2} \| \nabla \psi \|^2 - C_{\delta, \mathcal{L}} \max_j |l_j(\psi)|^2,$$

for any positive δ . Consequently

$$\begin{aligned} \sum_k H_k \| \Delta \psi_k \|^2 &\geq \min_k H_k \sum_k \| \Delta \psi_k \|^2, \\ &\geq \frac{1-\delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2} H' \| \nabla \psi \|^2 - \tilde{C}_{\delta, \mathcal{L}} \max_j |l_j(\psi)|^2, \\ &\geq \frac{1-\delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2 a_2^2} H' \| \theta \|_{-1}^2 - \tilde{C}_{\delta, \mathcal{L}} \max_j |l_j(\psi)|^2, \end{aligned}$$

for any positive δ . Using this formula, the estimate (27), and the constants in (10), we obtain

$$\begin{aligned} \frac{d \| \theta \|_{-1}^2}{dt} + \left\{ \mu \frac{1-\delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2 a_2^2} H' - \frac{c_{\infty}^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \sum_k H_k \| \Delta \bar{\psi}_k \|^2 \right\} \| \theta(t) \|_{-1}^2 &\leq (28) \\ &\leq \mu \tilde{C}_{\delta, \mathcal{L}} \max_j |l_j(\psi)|^2 \end{aligned}$$

for any positive δ . We now proceed as in [18] and using [18, Lemma 3.1] along with formula (12) for $T = \mu^{-1} c_2^{-1}$, we obtain that $\| \theta(t) \|_{-1} \rightarrow 0$ as $t \rightarrow \infty$ provided

$$\mu \frac{H'}{c_{\infty}^2 a_2^2 \varepsilon_{\mathcal{L}}^2} - \frac{2 \| v \|^2 c_{\infty}^2}{\mu^3 H_1 \lambda_1^2 a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) > 0,$$

which we rewrite

$$\varepsilon_{\mathcal{L}} < \frac{a_1 \lambda_1 \mu^2 \sqrt{H_1 H'}}{a_2 \| v \| \sqrt{2} c_{\infty}^2} \min_k \left(\sqrt{\frac{H_k}{\alpha_k}} \right).$$

Proof of theorem 3.2. We recall the estimate (26) of the proof of theorem 3.1 :

$$\begin{aligned} \frac{d \| \theta \|_{-1}^2}{dt} + \mu \sum_k H_k \| \Delta \psi_k \|^2 + 2 H_K \sigma \| \nabla \psi_K \|^2 &\leq \\ &\leq \frac{1}{\mu} \sum_k \alpha_k \| \bar{\psi}_k \|_{H^2}^2 \| \nabla \psi_k \|^2 \end{aligned}$$

where α_k is defined by (15). Since the family \mathcal{L} satisfies (17), we have

$$\sqrt{\sum_{k=1}^{K-1} \|\nabla \psi_k\|^2} \leq C_{\mathcal{L}} \max_j |l_j(\psi)| + \varepsilon_{\mathcal{L}} c_{\infty} \sqrt{\sum_{k=1}^{K-1} \|\Delta \psi_k\|^2}.$$

We then obtain

$$\begin{aligned} \sum_{k=1, \dots, K-1} H_k \|\Delta \psi_k\|^2 &\geq \min_{k=1, \dots, K-1} H_k \sum_{k=1, \dots, K-1} \|\Delta \psi_k\|^2, \\ &\geq \frac{1-\delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2} H'' \sum_{k=1}^{K-1} \|\nabla \psi_k\|^2 - \tilde{C}_{\delta, \mathcal{L}} \max_j |l_j(\psi)|^2, \end{aligned}$$

for any positive δ . We then have

$$\begin{aligned} \frac{d \|\theta\|_{-1}^2}{dt} + \mu \frac{1-\delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2} H'' \sum_{k=1}^{K-1} \|\nabla \psi_k\|^2 + (\mu \lambda_1 + 2\sigma) H_K \|\nabla \psi_K\|^2 &\leq \\ &\leq \frac{c_{\infty}^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \sum_{k=1}^K H_k \|\Delta \bar{\psi}_k\|^2 \|\theta\|_{-1}^2 + \mu \tilde{C}_{\delta, \mathcal{L}} \max_j |l_j(\psi)|^2. \end{aligned}$$

Let us introduce

$$m(\varepsilon_{\mathcal{L}}, \sigma) = \min \left(\mu \frac{1-\delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2 a_2^2} H'', \frac{\mu \lambda_1 + 2\sigma}{a_2^2} H_K \right).$$

The last inequality gives

$$\begin{aligned} \frac{d \|\theta\|_{-1}^2}{dt} + \left(m(\varepsilon_{\mathcal{L}}, \sigma) - \frac{c_{\infty}^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \sum_{k=1}^K H_k \|\Delta \bar{\psi}_k\|^2 \right) \|\theta\|_{-1}^2 &\leq \\ &\leq \mu \tilde{C}_{\delta, \mathcal{L}} \max_j |l_j(\psi)|^2. \end{aligned} \quad (29)$$

We then proceed as in the proof of theorem 3.1 and obtain that, if

$$\left(m(\varepsilon_{\mathcal{L}}, \sigma) - \frac{c_{\infty}^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \frac{2 \|\psi\|^2}{\mu^2 H_1 \lambda_1^2} \right) > 0$$

i.e. if $\varepsilon_{\mathcal{L}}$ and σ satisfy (18) and (19) then $\|\theta(t)\|_{-1}^2 \rightarrow 0$ as $t \rightarrow \infty$.

If we assume that some layers (e.g., k_j layers, $j = 1, \dots, s$) have large enough viscosities (the coefficients before $\Delta^2 \psi$ in the main equation), then using similar method,

we can prove that the behaviour of these layers is completely determined by other (essential) layers.

Proof of theorem 3.3. Rewriting in an uniform way the inequalities (28) and (29), for both cases we have, with $\theta = \theta^{(1)} - \theta^{(2)}$,

$$\frac{d \|\theta\|_{-1}^2}{dt} + a(t) \|\theta\|_{-1}^2 \leq C C_{\mathcal{L}}^2 \max_j |l_j(\psi)|^2 \quad \forall t \in \mathbb{R}$$

with

$$a(t) = \left\{ \mu \frac{1 - \delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2 a_2^2} H' - \frac{c_{\infty}^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \sum_k H_k \|\Delta \psi_k^2\|^2 \right\}$$

in the first case, and

$$a(t) = \left\{ m(\varepsilon_{\mathcal{L}}, \sigma) - \frac{c_{\infty}^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \sum_{k=1}^K H_k \|\Delta \psi_k^2\|^2 \right\}$$

with

$$m(\varepsilon_{\mathcal{L}}, \sigma) = \min \left(\mu \frac{1 - \delta}{\varepsilon_{\mathcal{L}}^2 c_{\infty}^2 a_2^2} H'', \frac{\mu \lambda_1 + 2\sigma}{a_2^2} H_K \right)$$

in the second one. If condition (20) is verified, we have

$$\frac{d \|\theta\|_{-1}^2}{dt} + a(t) \|\theta\|_{-1}^2 \leq 0 \quad \forall t \leq t_0.$$

Integrating this last inequality between s and t , we obtain

$$\|\theta(t)\|_{-1}^2 \leq \|\theta(s)\|_{-1}^2 \exp \left(- \int_s^t a(\tau) d\tau \right). \quad (30)$$

Consider now that $\theta^{(i)}$ belongs on the attractor. We then have for all $t \in \mathbb{R}$

$$\|\theta^{(i)}(t)\|_{-1}^2 \leq \frac{\|v\|^2}{\mu^2 H_1 \lambda_1^2 c_2} \quad (31)$$

$$\frac{1}{T} \int_t^{t+T} \sum H_k \|\Delta \psi_k^{(i)}\|^2 d\tau \leq \frac{\|v\|^2}{\mu^2 H_1 \lambda_1^2} \left(1 + \frac{1}{\mu T c_2} \right), \quad \forall T > 0. \quad (32)$$

Moreover, by conditions (14) or (18) - (19), we have

$$a(t) > \frac{c_\infty^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \left[\frac{2 \|v\|^2}{\mu^2 H_1 \lambda_1^2} - \sum_{k=1}^K H_k \|\Delta \psi_k^2\|^2 \right].$$

Combining the above inequality with (32),

$$\int_s^t a(\tau) d\tau > \frac{c_\infty^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \left[\frac{2 \|v\|^2}{\mu^2 H_1 \lambda_1^2} (t-s) - \frac{\|v\|^2}{\mu^2 H_1 \lambda_1^2} \left((t-s) + \frac{1}{\mu c_2} \right) \right],$$

and then

$$\int_s^t a(\tau) d\tau > \frac{c_\infty^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \frac{\|v\|^2}{\mu^2 H_1 \lambda_1^2} \left[1 - \frac{1}{\mu(t-s)c_2} \right] (t-s).$$

Thus, for $s < t - \frac{2}{\mu c_2}$,

$$\int_s^t a(\tau) d\tau > \frac{c_\infty^2}{\mu a_1^2} \max_{k=1, \dots, K} \left(\frac{\alpha_k}{H_k} \right) \frac{\|v\|^2}{\mu^2 H_1 \lambda_1^2} \frac{1}{2} (t-s) = A(t-s) \quad (33)$$

for any $-\infty < s \leq t - \frac{2}{\mu c_2} < t < t_0$. Combining (30) with (31) and (33) gives

$$\|\theta(t)\|_{-1}^2 \leq C \exp(-A(t-s)).$$

Now if we let $s \rightarrow -\infty$ we obtain $\|\theta(t)\|_{-1} = 0 \quad \forall t \leq t_0$. We thus obtain $\theta^{(1)}(t) = \theta^{(2)}(t)$ for $t \leq t_0$. The uniqueness theorem for the system (1),(2) yields that $\theta^{(1)}(t) = \theta^{(2)}(t)$ for $t \in \mathbb{R}$.

5 Acknowledgments.

The authors would like to thank Professor M. Pierre for very stimulating discussions on the subject. This paper was written while I.C. was visiting the Institut Elie Cartan (Nancy 1). He would like to thank people at this institution for their very kind hospitality. He is especially grateful to Professor P.A. Vuillermot. Thanks to his efforts this visit became possible and was very fruitful. The University Henri-Poincaré-Nancy 1 and the French-Russian Lyapunov Center are also highly acknowledged for their financial support.
